An examination is made of condensation on non-
 soluble nuclei and on nuclei soluble in a liquid. It was
 found that, for polar substances on even surfaces the
 vapor adsorption isotherm cuts the vapor tension
 isotherm, and new liquid phase formation occurs in
 certain instances by an intermittent process of two-
 dimension nucleus formation. The liquid phase forms
 a marginal angle distinct from zero. The mechanism
 of vapor condensation on incompletely wetted particles
 was analyzed and it was found that the introduction of
 vapors of certain organic liquids may change the

DESCRIPTORS: *Insecticides, *Particles,
 *Sedimentation, Tests.

An investigation of sedimentation of DDT and hexa-
 chlorane dusts in a vertical aerodynamic tube indicated
 that sedimentation of dust-like particles is not as high
 as is indicated by the Stokes' Formula either with or
 without the correction by Shelekhovskii. This is be-
 cause the particles form agglomerates. When calculat-
 ing sedimentation velocity, the "assumed density" of
